

Notes 7

Wildcards

"The * Wildcard" The asterisk (*) matches **zero or more characters** in a filename. Examples:

- To list all the text files in a given directory that start with letter f
 - `ls + Downloads/f*.txt`
- To list only CSS files in a single column:
 - `ls + -X1*css`
- To list all files inside a directory that contain word "random" in the name.
 - `ls + directory + /*random*`
- To move specific files from one directory to another
 - `mv + `Downloads/Movies/{.png,.gif} Downloads/Movies/MCU/`

The ? Wildcard The ? Wildcard metacharacter matches **precisely one character**. Examples:

- To list all hidden files in current directory:
 - `ls ./.*??*`
- To list all files that have 2 characters in the filename between letters b and k
 - `ls b??k*`
- To list all files with a 2 letter file extension
 - `ls *.??`
- To list all the files in a directory that are hidden and have a 2 letter file extension
 - `ls directory/.??*??`

☐ **Wildcard** The brackets wildcard matches a single character in a range. The brackets wildcard use the exclamation mark to reverse the match.

- To match all files that have a vowel after letter f
 - `ls + f[aeiou]*`
- To match all files that do not have a vowel after letter f
 - `ls + f[^aeiou]*`
- To match all files that have a range of letters after f
 - `ls + f[a-z]*`

Brace Expansion

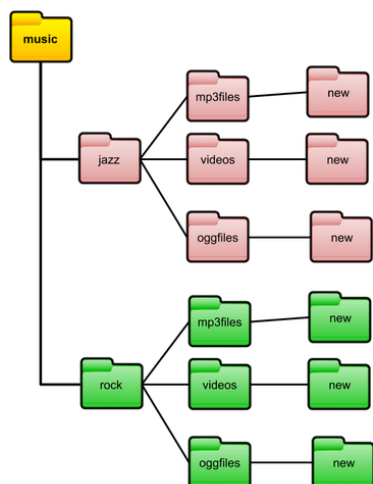

- How to use Brace Expansion to create entire directory structures. Include at least 2 examples+ Brace expansion is a feature of the bash shell that generates argument strings. Brace expansion does not make calls to the OS like wildcards do. They simply generate file names based on a given pattern. To use Brace expansion:
 1. Start with an open brace
 2. With no spaces, type your string separating entries by a command
 3. Close the brace

Example:

- `mkdir -pv `example_site/{assets/large,docs/share,scripts/js}`

To Create 3 different files with the same name but different file extensions:

- `touch + file.{md,txt,rtf}` To create 10 files in a range from 0 to 9:
- `touch + file{0..9}.txt` To remove specific files that start with a given keyword:
- `rm + image_{01..08}*_camera.{png,jpg}` To create an entire directory tree in a single command (1 level deep):
- `mkdir + -pv + `project_venus/{code,source,dataset}/new`

天は人の上に人を造らず人の下
を造らずと云へり。されば、賢
愚人との別、貧者と富者との別
皆その人の学に在るべし。

"It is said that heaven does not create one man above o
below another man. Any existing distinction between the
wise and the stupid, between the rich and the poor, com
down to a matter of education."
Fukuzawa Yûmeiji
